

DEADBOLT LOCKS

1. Single cylinder deadbolt

The bolt is the part of the lock that penetrates the doorframe. A single cylinder deadbolt is activated on the outside by a key and on the inside by a twist knob. The handle only serves to pull the door with this type of lock.

Examples :

2. Double cylinder deadbolt

The cylinder is activated by a key both from the outside and the inside. (recommended for doors close to a pane of glass).

Examples :
